

S46: Focal taxon required — balance after structural screening
Both full and confidence-masked alignments must pass; alignment-E-value annotation policy

n = minimum aligned residues; c = minimum coverage (%) of each original protein; N = retained matches
Descriptive diagnostics, not structural effects. Guides are dependent sensitivity alternatives. Color scales differ by metric, fixed across scenarios.
Positive-log distance excludes zero-distance pairs; exact per-feature denominators are in plotted_values.tsv.
