

FCS omission sensitivity: paired changes in conditional coupling estimates

Points: fitted differences. Lines: unadjusted 95% percentile intervals from 2,000 paired whole-marker draws. All 24 specifications and five contrasts shown.

Each baseline/FCS pair uses its cohort's fixed baseline references; panel scales differ. Base: coverage/confidence controls; +Comp: amino-acid composition controls.

Copy-review omission excludes marker 4986044at2759. Structural alphabet labels are fitted models; all predictions in these cohorts are ESMFold.

Intervals are conditional on estimated rates and fixed gene trees. No multiple-testing significance, equivalence, causal effect or structural-acceleration claim.
