

Coalescent versus concatenated species relationships

Coalescent alignment/support sensitivity

Normalized Robinson–Foulds distance

Different splits / $[2 \times (\text{retained taxa} - 3)]$.
Every comparison uses identical retained taxa.

P = profile; M = MAFFT. Reference labels:
alignment / guide, with ML or consensus view.
SH10 / SH80 = gene SH-aLRT contraction setting.

All 75 unique candidate pairs are shown once;
gray diagonal/upper cells are not additional data.

Point-tree comparisons are descriptive.
Support metrics retain separate definitions.
No preferred tree, biological root or cause
of discordance is assigned.
