

Ecological state changes: stable counts, uncertain locations

2 guide ensembles × 1,000 bootstrap trees; root-free, equal-cost state mapping

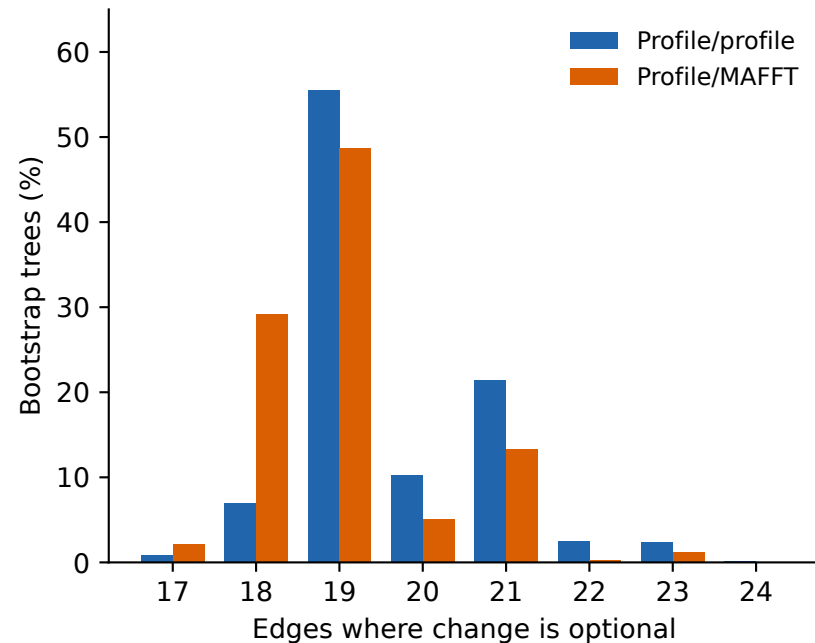

A Change required in every optimal mapping

Percentage of bootstrap trees

B Ambiguity across complete trees

Same distributions under both codings

Every tree has minimum score 7 with original coding, or 6 with Ramaria unknown.

* Ramaria is unassigned in this sensitivity coding; 0% does not establish ecological stasis.

Fractions describe mapping sensitivity, not posterior probabilities or independent origins. Optional edges are jointly constrained.
